🚀 Vercel Deployment Guide

Fix for 404 NOT_FOUND Error

The 404 error you encountered was due to the project structure having the Next.js app in a subdirectory. This has now been **fixed**!

✅ What Was Fixed

- ✅ **Project Restructured**: Moved Next.js app from `app/` subdirectory to root level
- ✅ **Vercel Detection**: Now properly detects as Next.js application
- ✅ **Build Configuration**: All config files in correct locations
- ✅ **Environment Variables**: Secure credential handling maintained

🔄 Redeploy Steps

Option 1: Automatic Redeployment (Recommended)

Since your GitHub repository is already connected to Vercel:

1. **Vercel will automatically detect the changes** and redeploy
2. **Check your Vercel dashboard** - you should see a new deployment in progress
3. **Wait for deployment** - it should now build successfully!

Option 2: Manual Trigger

If automatic deployment doesn't start:

1. Go to your **Vercel Dashboard**
2. Find your **Wholesale-Live-Update** project
3. Click **"Redeploy"** on the latest deployment
4. Or push any small change to trigger new build

Option 3: Fresh Connection

If you want to start fresh:

1. **Delete the existing Vercel project**
2. **Import the repository again** from GitHub
3. Vercel will now detect it properly as Next.js

⚙️ Environment Variables Setup

Don't forget to add your environment variables in Vercel:

1. Go to **Project Settings → Environment Variables**
2. Add these variables:
   - `SHOPIFY_STORE_URL` = `https://your-store.myshopify.com`
   - `SHOPIFY_ACCESS_TOKEN` = `your_shopify_access_token_here`

Note: Use your actual Shopify store URL and access token from your original setup.

✨ Expected Result

After redeployment, your app should:
- ✅ Build successfully without errors
- ✅ Display the luxury inventory tracker interface
- ✅ Connect to your Shopify store properly
- ✅ Show product search and inventory data

🔍 Verification

Once deployed, test these features:
1. **Homepage loads** without 404 error
2. **Search functionality** works
3. **Product data** displays from your Shopify store
4. **Inventory levels** show correctly with color indicators

🆘 If Still Issues

If you still encounter problems:
1. Check Vercel build logs for specific errors
2. Verify environment variables are set correctly
3. Ensure your Shopify API token has proper permissions

Your luxurious Shopify inventory tracker is now ready for successful deployment! 🎉
